| <b>Agenda item:</b> QA                                   | <b>Presenter:</b> All member     |

## Discussion:

- 1, Whether the MMS should be distinguished in the UI interface, according to the Client's opinion, they should not be split because their data formats are very similar.
- 2, Search and edit pages can be operated for up to -5 years, then search for +1 years, for example, in 2019, we should only be able to operate data from 2014 to 2020.
- 3, There should be different prompts after editing the information in the system. And there should be a garbage bin to store the deleted data, not directly deleted in the database, if it is not needed in the future time period, then delete it after a period. When storing changes, there should be a prompt, this prompt should be summary, and what has been modified. For example, the short description has changed A->B

- 4, We should put a create button in the search place, if the user does not search for the need, then they can directly add new content.
- 5, On the search and edit pages, each line should be more distinguishable, such as gray and white, or gray and blue.
- 6, When a user searches for any course, if a click is made, then the clicked place should change color, which proves that some specific content has been clicked.
